I'm having a hard time figuring out how to use PostgreSQL's dynamic typed columns. I've figured out how to use the SQL of my query in jOOQ, but the problem is, the columns are just hardcoded. So the jOOQ generated SQL would look something like: SELECT table1.id, table1.name, table2.id FROM table1 INNER JOIN table2 ON table2.id = table1.id But I want to be able to generate the table names dynamically based on what's stored in the database.

I've been trying to do this with the `Sql.using()` method: `Sql.using(Connection c) { return c.select(tableName).from(TableName.tableName).where(...); }` but that doesn't seem to work. Any help is appreciated! A: TL;DR Use `DSL.using(SqlDialect)`: This method will allow you to use dynamic fields as shown in the following example: `DSL.using(SqlDialect.POSTGRES_9_2, r -> DSL.using(r.loadSchema(new Table2()) 82157476af`
